Contract Task Order No. WE04

Subject: Temporary Discharge Monitoring Report - November 1 to November 30, 2023
Hangar 680 Per- and Polyfluoroalkyl Substances Pilot Test System
Former Naval Air Station Joint Reserve Base Willow Grove
Horsham Township, Pennsylvania

Dear Mr. Magge:

On behalf of the United States (U.S.) Navy, Tetra Tech is pleased to submit the Temporary Discharge Monitoring Report (DMR) for the Hangar 680 per- and polyfluoroalkyl substances (PFAS) pilot test system at the Former Naval Air Station Joint Reserve Base Willow Grove in Horsham Township, Pennsylvania. This DMR includes available influent, effluent, and field quality assurance/quality control (QA/QC) results for sampling from November 1 to November 30, 2023.

The temporary discharge was first approved by the Pennsylvania Department of Environmental Protection (PADEP) on February 10, 2020, as requested by the U.S. Navy under a Federal Facility Agreement permit equivalency. PADEP approved subsequent modifications to the permit equivalency in letters dated September 5, 2020, January 27, 2021, July 23, 2021, January 13, 2022, July 1, 2022 (modified on September 12, 2022), and December 28, 2022. PADEP approved a request to extend the permit equivalency duration for 180 more days on June 14, 2023. In addition to previous sampled parameters, the Navy began sampling for perfluorobutanoic acid (PFBA) on June 26, 2023. The Navy submitted a request for an extension to PADEP on December 14, 2023.

Full-time operation of the Hangar 680 PFAS pilot test system was initiated on March 2, 2020. A total of 33,916,218 gallons of water have been treated and discharged to Outfall 8 as of November 27, 2023. The discharge for the reporting period complied with the effluent limitations and monitoring requirements as summarized in the following bullets:

- Influent samples were collected on November 6 and November 20, 2023. These samples were collected from shallow extraction well HA-EW-1S, the first intermediate extraction well HA-EW-1I, the second intermediate extraction well HA-EW-2I, and the combined influent of these extraction wells. These samples were analyzed for PFAS, specifically PFOA, and PFOS, and the results are provided in Table 1. During this reporting period, the first shallow extraction well HA-EW-1S was operated at approximately 4.4 gallons per minute (gpm), the first intermediate extraction well, HA-EW-1I was operated at approximately 8.3 gpm. The second intermediate extraction well HA-EW-2I was operated at approximately 8.1 gpm. Results for the November 20, 2023 sample date at locations HA-EW-1S, HA-EW-1I, HA-EW2I, and the combined influent are pending at the laboratory.

- Effluent samples were collected on November 6 and November 20, 2023, and analyzed for PFAS, specifically PFOA and PFOS. Effluent samples for tetrachloroethene (PCE), trichloroethene (TCE), carbon tetrachloride (CTC), 1,2-dichloroethane (1,2-DCA), and total lead also were collected on November 6, 2023. All effluent analytical sample results for this reporting period are provided in Table 2. An anomalous PFOS value was observed in the second effluent duplicate sample during this reporting period which was not supported by its parent sample. The laboratory will re-extract and re-analyze the sample if there is a sufficient volume of sample remaining. The results will be reported in the December 2023 DMR if the sample was re-analyzed. Field blank QA/QC samples were collected on November 6 and November 20, 2023. During this reporting period, the system discharge was approximately 20.8 gpm.
- Trip blank QA/QC samples were collected on November 6, 2023. These samples were analyzed for PCE, TCE, CTC, and 1,2-DCA. The results are provided in Table 2.
- Per the June 14, 2023 permit equivalency extension, biweekly monitoring of PFOA and PFOS shall be conducted at discharge sampling port HA-Mid2IX to determine if maintenance actions are needed. During this reporting period, all PFOA and PFOS sampling results at HA-Mid2IX were below the Pennsylvania Department of Environmental Protection maximum contaminant levels described in the permit equivalency modification (0.014 µg/L PFOA and 0.018 µg/L PFOS). Therefore, no maintenance actions based on this requirement were deemed necessary before the next reporting period.

The aqueous IDW treatment system was not operated during this reporting period; therefore, there are no discharge results to report.

Lastly, analytical results from samples collected since the start of the Hangar 680 PFAS pilot test system and intermittent operation of the aqueous IDW treatment system have demonstrated that both systems continue to effectively reduce the compounds identified in the permit equivalency to below the established limits.

Please do not hesitate to contact me if you have any questions.

Sincerely,

Tricia E. Moore, PG
Senior Project Manager

TEM/nfs
